Introduction

Cinephile is a web application that allows users to keep track of the movies they've seen and uses their personalized list to make recommendations based on their most watched genre and what other people enjoy from that genre. Cinephile uses the OMDb API. OMDb is a RESTful web service used to obtain information about movies such as genre, title, year, runtime, and movie posters.

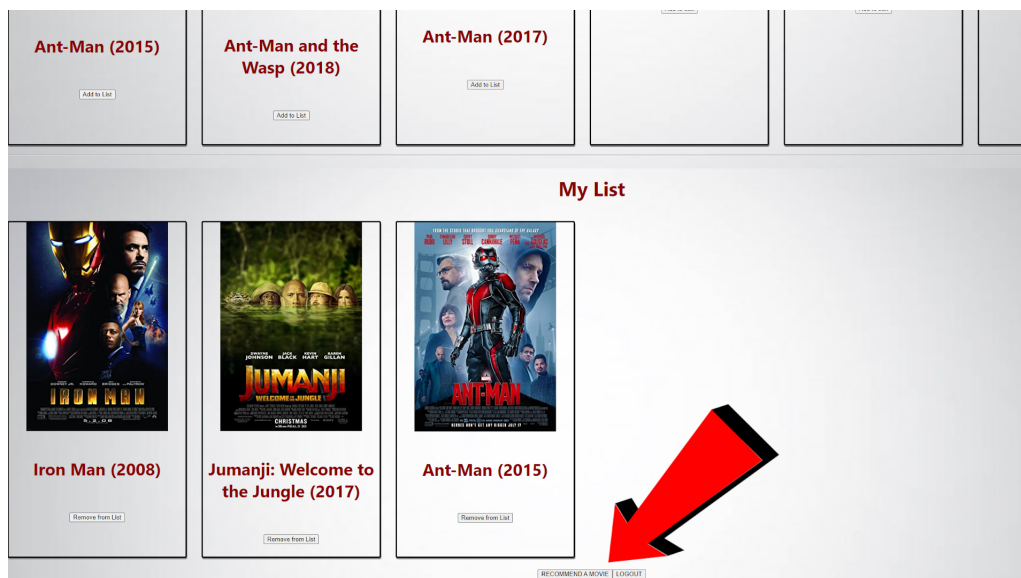

How to use

The first step to using Cinephile is the login page, here you type in your username and password so your list of movies and recommendations are readily available for when you decide to use the application again.

The next step is to search for a movie and add it to your list. The more movies you add in this way, the more accurate your movie recommendation will be. Movies are displayed with the title, poster, and year to assure that you've selected the exact one you're looking for.

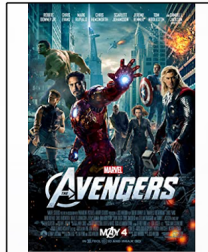

After you've searched for your movies and added them to your list, you can click the "recommend a movie" button. This will bring you to a display of your recommended movie, the year it was released, a rating out of 10 from the public, the corresponding movie poster, and also a brief description of the film.

Final Result

Recommended Movie

The Avengers (2012)

Earth's mightiest heroes must come together and learn to fight as a team if they are going to stop the mischievous Loki and his alien army from enslaving humanity.
